Setting up and using ESLint

- Install ESLint

  ```
  npm i --save-dev eslint
  ```

- Create the ESLint configuration file. Choose Browser environment, style guide (AirBNB), include TypeScript support, choose JSON format for the file.

  ```
  ./node_modules/.bin/eslint --init
  ```

  NOTE: Use backslashes on Windows

- Create a .*eslintignore* file. Make sure to ignore all code except the ones you created as part of the app (ignore node_modules, Font Awesome folder, libs folder, dist folder etc.)
  Reference: Check https://eslint.org/docs/user-guide/configuring/ignoring-code#ignorepatterns-in-config-files for file path patterns (glob patterns) to specify files and folders to ignore

- Add a lint script to package.json. Also add one to automatically fix where possible the lint issues

  ```
  "scripts" : {
    "lint": "eslint . --ext .js",
    "lint:fix": "eslint . --ext .js --fix"
  }
  ```

- Run ESLint

  ```
  npm run lint
  ```

  Make necessary changes to the *rules* section in .*eslintrc.json* file as per your team's standards.
